

The Luxury Wellness Brand Audit Checklist

15 critical checkpoints to evaluate if your website reflects the quality of your practice

By Naoman Saeed · Bespoke Web Engineer

I created this checklist after evaluating dozens of wellness professional websites and seeing the same patterns: talented practitioners with beautiful work, but websites that fail to communicate their value. These are the 15 checkpoints I use when assessing whether a luxury wellness site is serving its purpose - or silently turning away ideal clients.

This isn't about whether your site is "pretty." It's about whether it performs. Whether it converts. Whether it reflects the care and intention you put into your craft.

How to Use This Checklist

Go through each item below. Mark ✓ if your site passes, X if it fails.

For items that require technical measurement, I've included free tools. Don't guess - test it.

If you fail more than 5 items, your website may be costing you clients. If you fail more than 10, it's time for a conversation.

Category 1: First Impressions

- ☐ 1. Does your site load in under 2.0 seconds on mobile?

How to measure: Run your URL through [Google PageSpeed Insights](#). Look for "Largest Contentful Paint" - it should be under 2.0 seconds.

- ☐ 2. Does your site use 3 or fewer colors from a cohesive palette? Does it have plenty of white space (not cramped)? Does it feel calm, not chaotic?

How to measure: Look at your homepage. Count the colors. If you see more than 3 distinct colors, or if the page feels busy and overwhelming, mark X.

- ☐ 3. Is your main image sharp (not blurry or pixelated)? Does it show your work, your space, or your clients (not generic stock photos)? Does it load instantly when you visit your site?

How to measure: Visit your homepage on your phone. Is the first image crisp? Does it represent your actual business, or is it a stock photo visitors might see elsewhere?

Category 2: Mobile Experience

- ☐ 4. Does your site look and function perfectly on phones?

How to measure: Use [Google's Mobile-Friendly Test](#). It will tell you if your site is mobile-friendly and show you how it looks on a phone.

- ☐ 5. Can you easily tap every button and link on your phone without accidentally hitting the wrong thing? Are buttons large enough that your thumb can tap them comfortably?

How to measure: Open your site on your phone. Try to tap every button and link. If you frequently tap the wrong thing or have to zoom in to tap accurately, mark X.

- ☐ 6. Does content fit the screen width without side-scrolling?

How to measure: Visit your site on your phone. Can you read everything without swiping left or right? If you have to scroll horizontally to see content, mark X.

Category 3: Navigation & Clarity

- ☐ 7. Is there one obvious next step on every page?

How to measure: Visit any page on your site. Can you immediately identify what you're supposed to do next? (Book a call, download a guide, contact you?) If you're unsure, mark X.

- ☐ 8. Can visitors find what they need in 2 clicks or less?

How to measure: From your homepage, can you reach your services, about, and contact pages in 2 clicks? If it takes more, mark X.

- ☐ 9. When you look at any page, can you immediately see what's most important? Or does your eye get lost in too much text, too many images, or too many colors?

How to measure: Visit any page on your site. Close your eyes, then open them. Can you immediately identify the most important element? Or does your eye wander aimlessly?

Category 4: Accessibility

- ☐ 10. Do all text elements meet 4.5:1 contrast ratio (WCAG 2.2 AA)?

How to measure: Use the [WebAIM Contrast Checker](#). Enter your text color and background color - it will tell you if it passes WCAG 2.2 AA standards.

- ☐ 11. Can your entire site be used without a mouse?

How to measure: Unplug your mouse (or don't use your trackpad). Try to navigate your entire site using only the Tab key. Can you reach every link, button, and form field? Can you see which element is focused?

- ☐ 12. Are interactive elements clearly highlighted when focused?

How to measure: Use the [WAVE Accessibility Tool](#). Enter your URL - it will show you focus order and highlight accessibility issues.

Category 5: Trust & Conversion

- ☐ 13. Do you display testimonials, reviews, or credentials prominently?

How to measure: Visit your homepage. Can you see social proof (client testimonials, reviews, certifications, press mentions) within 5 seconds? If not, mark X.

- ☐ 14. Is there a clear way for visitors to join your mailing list?

How to measure: Can you find an email signup form or newsletter subscription option on your site within 10 seconds? If not, mark X.

- ☐ 15. When someone visits your site, do they understand your unique approach within 5 seconds? Does your site reflect your personality and philosophy, or does it feel like a generic template?

How to measure: Ask a friend to visit your site for 5 seconds, then close it. Ask them: "What is this business about? What makes it different?" If they can't answer clearly, mark X.

Your Score

Count how many items you marked with ✓:

13-15 ✓

Excellent - your site reflects your brand's quality

9-12 ✓

Good - minor improvements needed

5-8 ✓

Needs work - your site may be costing you clients

0-4 ✓

Critical - immediate attention required

Common Failure Patterns

Most wellness sites fail items 1, 4, 7, and 10. These four failures alone can reduce conversions by 40-60%.

- **Item 1 (Load Time):** Slow sites lose 53% of mobile visitors before they see your work
- **Item 4 (Mobile):** 60% of wellness searches happen on phones - if your site isn't mobile-friendly, you're invisible
- **Item 7 (Clear CTA):** Visitors who don't know what to do next leave without contacting you
- **Item 10 (Contrast):** Poor contrast excludes 1 in 12 visitors with visual impairments

Your Next Step

If you scored below 9, it's time for a conversation. A hand-coded website can address these issues systematically, giving you a site that performs as beautifully as your practice.
